Crit Int: Przem. chem., 1956, 12, 12, 687-93.

Abstract: A method of preparation of aryl xysilxane and aryl xysilxane oils and resins by partial hydrolysis of ester of orthosilicic acid was developed. From 0.1 to 1.4 mole of water per 1 mole of orthoester was taken for the preparation of oils, and from 1 to 1.4 mole of water per 1 mole of orthoester was taken for the preparation of resins. The polycondensation of products

Prace Instytutu Lotnictwa, Nr. 12 (Aviation Institute, Papers, no. 12) Warsaw,
1960. 63 p. 500 copies printed.

Sponsoring Agency: Zjednoczenie Przemysłu Lotniczego.

Editorial Board: Chief Ed.: Stanisław Antoni Witkowski, Master of Engineering;
Ed. of this issue: Halina Wyżanowicz, Master of Engineering.

PURPOSE: This publication is intended for engineers and scientific workers in
the aircraft industry.

COVERAGE: The publication contains articles on the coating and anodizing of
aluminum surfaces, improving the quality of rubber by polymers, and the
corrosive effect of hand prints. The articles are based on the authors'
own theoretical and laboratory research work and are especially valuable
for those working in the aircraft industry. Summaries accompany each article.
No personalities are mentioned. References follow each article.

TITLE: Photomechanical effect produced in sodium-chloride crystals

SOURCE: Conference on Acoustics of Solid Media. Warsaw, 1964. Proceedings.
Warsaw, PWN, 1966, 29-36

TOPIC TAGS: ultrasonic wave, sodium chloride, ultrasonic wave attenuation, photomechanical effect, low temperature effect, sodium chloride crystal

ABSTRACT: Attenuation of ultrasonic longitudinal and shear waves of 10-Mc frequency in gamma-irradiated, or additively colored and deformed, sodium-chloride crystals was measured. A photomechanical effect, which consists of sudden and reversible attenuation changes upon exposure to light, was observed in crystals containing new dislocations as well as in irradiated or additively colored crystals. It appears that this effect is caused by the interaction of fresh dislocations with point defects unpinned during illumination. A maximum attenuation decrease was noticed when crystals were illuminated at a temperature range

Card 1/2

L 05428-67

ACC NR: AT6032812

of 78K to 573K with light of 4650 \AA wavelength. Maximum attenuation increase occurred with light of 6300 \AA wavelength. Attenuation increases due to illumination at low temperatures were termed by the authors as a negative photomechanical effect. Orig. art. has: 9 figures and 2 tables. [Based on authors' abstract]

Section 2. Ultrasonic Testing of Pressure Welded and Welded Joints

Pracowni polskich zgrzewarki i spawanych metod ultradźwiękowych.
"Przegląd Spawalnictwa", No. 6, 1959, pp. 120-137, 53 figs.

The increasingly severe demands made on the performance of machine and construction joints necessitate an early detection of defects caused either by faulty technical processes or by fatigue of materials. The ultrasonic method of testing pressure welded and welded joints is recommended for use in early defect detection. The

method of ultrasonic testing makes it possible to determine the structure of the objects, and the frequency of vibrations. An explanation is included of the interpretation of ultrasonic results and of patterns simplifying such interpretation.

Title : Comparison of Detectability by Means of Ultrasonic Method
and X-ray I in Testing Welded Joints

Ori. Pub : Proc. II. conf.ultrason., 1956, Warszawa, PWN, 1957, 175-169

Abstract : The author describes an ultrasonic flow detector, acting on the principle of a converter, operating as a radiator, and receiver at frequencies of 1.5, 3, and 4.5 Mcs in pulsed mode. The course of the ultrasonic beam in the material node. The course of the ultrasonic beam in the material during the investigation is traced. The minimum dimensions of the flow that can be observed by the instrument is estimated to be 1 to 2 mm. Photographs are given for specimens of welded materials in which flows have been detected. It is concluded that the ultrasonic method for flow detection can serve for a rapid preliminary investigation of the material and for the determination of the depth of location.

("Wytrzymałość smęczeniowa tworzyw i elementów metalowych", Warszawa.
1961, 45 - 49, Polish)

TEXT. Investigations were made on Al-alloy PA-4, containing 0.77% Mg, 1.05% Si and 0.66% Mn, after natural and artificial (at 160°C) aging during rotating bending and composite strained state (bending with torsion). Fatigue tests were carried out at different stresses on 10 - 20 specimens for each level. It was established that the straggling of experimental data for the alloy obeys the law of normal distribution. Fatigue curves were plotted in coordinates of stress σ versus the number of cycles N for various probabilities of failure. An analysis of these curves shows that the ratio of σ_w of the alloy after artificial aging to σ_w of the alloy after natural aging, was 1.13, i.e. much below the corresponding value for $\sigma_b = 1.54$ and $\sigma_{0.2} = 2.28$. The lesser value of this ratio for σ_w is apparently connected with the mechanism of developing fatigue fracture which is

TITLE:

Pulse ionization chamber for energy measurements of particles from decay of compound nuclei produced by neutron bombardment

PERIODICL:

Nukleonika, v. 7, no. 3, 1962, 183-192

TEXT: A grid ionization chamber filled with argon at atmospheric pressure was used for energy measurements of charged particles emitted from a layer of natural boron under irradiation with thermal neutrons from a Po-Be neutron source. The groups of α -particles and Li-recoils from the reactions: $B^{10}(n, \alpha) Li^{7*}$ and $B^{10}(n, \alpha) Li^7$ were established and the ratio of the yields was derived from the observed spectrum. The calibration of the chamber was performed using α -particles from U²³³ and Pa²³¹. There are 6 figures.

TITLE: Effect of gaseous admixtures to argon upon ionization work for
Alpha radiation

SOURCE: Warsaw. Politechnika. Zeszyty naukowe, no. 118, 1965.
Elektryka, no. 43, 43-54

TOPIC TAGS: argon, acetylene, ionization, Alpha radiation, particle
collision

ABSTRACT: The purpose of investigation was to obtain a mixture of argon with another gas, which has a minimal ionization work for radiation. Tests were carried out with a pulsing chamber. A noticeable reduction of ionization work was found in the argon with gaseous admixtures having a lower ionization potential than the exciting potential of metastable argon states. This phenomenon is considered a result of collisions of the second kind of admixed molecules with metastable argon atoms. A minimal ionization work of 21,1 eV has been obtained in the mixture of argon and acetylene as result of a resonant increase of the cross section of collisions leading to ionization. It

Card 1/2

56

53

21

2-

L 20311-66

ACC NR: AT6009309

has been experimentally ascertained that the minimum of ionization work is provided by a mixture containing 0,8% of acetylene. Analysis of experimental data has shown that the decrease of ionization work occurring in the mixture of argon with acetylene at low pressure is caused by the process of dual collision between the metastable argon atoms and acetylene particles. As the pressure in acetylene increases the ionization work also increases as result of triple collisions between the metastable argon atoms and two particles of acetylene. The author thanks Prof. Dr. Cezar Pawłowski for examining the study before it was put into print. Orig. art. has: 4 figures, 1 table and 4 formulas. [Author's abstract.]

TITLE: Electronic collimation of alpha particles in gridded ionization chamber

SOURCE: Nukleonika, v. 10, no. 7, 1965, 433-441

TOPIC TAGS: collimation, ionization chamber, alpha particle, electric field

ABSTRACT: Electronic collimation in a conventional gridded ionization chamber is described. This method, based on the evaluation of pulse rise time at the collector, allows direct information on the angle formed by the tracks of the particles with the electric field to be obtained. The energy resolution was improved about 30%, when the electronic collimation of α particles was used. Results of an investigation are presented for gas mixtures Ar + 2% N₂ and Ar + 0.8% C₂H₂. The authors thank Prof.-Dr. C. Pawlowski for reading of the manuscript prior to publication. Orig. art. has 8 figures, 9 formulas, and 1 table. NA

TITLE: Disinfection of shoes with peracetic acid
SOURCE: Vojenske zdravotnicke listy, no. 1, 1966, 31-35
TOPIC TAGS: fungus, skin disease, drug effect, clothing, disease control, military medicine, disinfectant
ABSTRACT: Interdigital mycosis is transmitted in the army mainly by insufficient disinfection of shoes when these are passed on from one soldier to another. As the fungus may survive for very long periods without contact with human body (even several years) only proper disinfection can prevent infection by the organisms. Peracetic acid was compared to other disinfectants currently used in the Czechoslovak Army (formaldehyde, formic acid, ethylene oxide). Trichophyton interdigitale and Candida albicans were used in the experiments. 0.5% - 1% solutions of peracetic acid acted faster than other disinfectants in the same concentrations and even a 1 minute exposure to 1% solution eliminated completely the fungi. Peracetic acid also penetrates deeper into the leather than other disinfectants. Major A. Kadlec and Ensign J. Chaloupek gave technical support.

Solutions.

Orig Pub: Zeszyt nauk. Politechn. slaskiej, 1957, No 12, 107-128.

Abstract: The Krakow Mineral Oil Institute studied the influence
of calcium cyanamide (I) on the corrosion rate (CR)
and the change of the irreversible electrode potential
(P) of iron (0.3% of C) in distilled and tap water and
in a series of salt solutions taking into consideration
the conditions of underground corrosion. This study

Title : Experiments on Precipitation of Some Industrial Aerosols

Orig Pub : Przem. chem., 1957, 13, No 2, 90-99

Abstract : Results of experiments on precipitation of particles from aerosols of NH_4NO_3 , NH_4Cl , H_2SO_4 by means of glass capillaries, porous glass Schott filter and a layer of sand. The precipitation is based upon the fact that increased velocity and pressure of the gas in the capillaries, or porous materials, result in increased number of collisions between aerosol particles and provide more favorable conditions for condensation of water vapor

Chromatopolarographic analysis of nitroaniline mixtures.
II. Quantitative determinations. Henryk Buchowski and
Wiktor Pawłowski. *Chem. Anal.* (Warsaw) 4, 145-9
(1959)(English summary); cf. C.A. 53, 13891c.—A mixt. of
3% aq. H₂SO₄ 1000, acetone 166.6, and CHCl₃ 88.3 g.
seps. into two layers. The aq. layer was used as eluate and
the CHCl₃ layer for swelling of rubber. Good results were
obtained on a glass column 4 cm. long and 0.48 cm. in diam.
packed with 100 mg. of rubber, swollen by CHCl₃ layer
used in aunts. of 3 ml./g. of rubber. Currents in the
effluent were recorded by means of a device described by
Kemula (C.A. 47, 7344d; *Przemysł Chem.* 33, 453(1954)).
The rate of out-flow was 10 ml./hr. Time of analysis can
be cut when meta and para isomers only are detd. in first 7-8
ml. and the content of *o*-nitroaniline is calcd. from the dif-
ference between total amt. and the sum of meta and para
isomers. Time of analysis is below 1 hr. and mean error
less than 1%. Polarograms are reproduced. Z. Kurtyka

Ultradźwiękowe metody badania materiałów (Ultrasonic Methods in Materials Research)
Warsaw, Państwowe wyd-wa techniczne, 1959. 272 p. Errata slip inserted.
1,753 copies printed.

Tech. Ed.: Bożenna Radzikowska.

PURPOSE: This book is intended for engineers and technicians engaged in
materials inspection.

COVERAGE: The book describes the physical principles of nondestructive ultrasonic
investigation of materials, and reviews the basic types of equipment used in
these processes. In particular, details of the application of ultrasonic methods
to the inspection of machine parts, forged and rolled items, welded joints, and
also to the investigation of industrial ceramics, concrete structures and
synthetic materials are given. No personalities are mentioned. There are 46
references: 19 Polish, 12 German, 11 English, 2 French, and 2 Czech.

with good results in cases where other substances had failed, even after a short period of application. Bacteriological examination after the application showed only saprophytic flora. The treatment prevented secondary infection, shortened the time of treatment, and gave a quicker and better preparation of the field for grafts.

High Refractory Insulating Brick Products. S. PAWLOWSKI
(Prace Instytutu Ministerstwa Hutyctwa, 1954, U. 12, 66-73).
(In Polish). The preparation of the following high refractory
bricks using the foam method is described: (1) From corundum
and lime, bulk density 0.7-0.9 g./c.c., cold crushing strength
20-30 kg./sq.cm. applicable for temperatures up to 1600° C.
(2) From corundum and portland cement, bulk density 0.8-
0.9 g./c.c., cold crushing strength 15-40 kg./sq. cm., for
temperatures up to 1800° C. (3) From corundum and fireclay,
kg./sq. cm., high refractoriness under load, high resistance to
thermal shock, applicable for temperatures up to 1800° C.
(4) Forsterite bricks, bulk density 1.00 g./c.c., cold crushing
strength 40-50 kg./sq. cm. applicable for temperatures up to
1550° C. (5) Silica bricks, bulk density 0.75-0.9 g./c.c., cold
crushing strength 20-60 kg./sq. cm. The method of manu-
facturing the silica bricks needs further research to prevent
cracking on firing. The applications of various types of
insulating refractories are discussed.—v. o.

POL.

V. Manufacture of insulating fireclay products by a gas-solution method. S. Pawlowski, Prace Inst. Ministerstwa Handlu i Przemyslu, Warszawa (Polish summary). Porous refractories of light weight are manufd. by mixing fireclay, dolomite, and dil. H₂SO₄, pouring the mixt into the molds, drying till <2% H₂O is left (first in air and then at 310°), by mixing 1 kg. of powder firebrick grog of 0.3-0.5 mm., 3 kg. of fireclay cl. <0.3 mm., 0.3 kg. of 5% H₂SO₄, 0.26 kg. of dolomite cl. <0.1 mm., and 0.8 kg. of gypsum (as stabilizer). After drying, the temp. is increased by 100°/hr. The products obtained have a bulk d. 0.65-0.70 g./cc., total porosity 70-75%, and cold crushing strength 10-15 kg./sq. cm. The products can be used up to 1200°. Ceramic or acid-resistant stainless-steel molds (which absorb water) are the most effective. The final products should be smaller than 400 mm. with a thickness <200 mm.

F. J. Hendel
